

This is a pattern for the Mama Bug, a foam glider for walkalong gliding (air surfing) on a wave of deflected air. Its slow flight makes it great for newbies, while its flight efficiency also makes it best for advance flying—like using only your hands to deflect the air to levitate it. However, the Mama Bug is only good if you make a perfect curve (camber) in the wing. Follow the directions (sciencetoymaker.org, look for “air surfing”) very carefully.

CAUTION: The thin foam used for the Mama Bug could be a choke hazard for small children.
